

## MONTGOMERY® SALIVARY BYPASS TUBE

### DESCRIPTION:

The Montgomery® Salivary Bypass Tube may be used to stent repair of cervical esophageal and hypopharyngeal strictures or to facilitate the management of fistulae resulting from a variety of causes including advanced malignancy, surgery, radiation, trauma, and caustic ingestion. The constant bathing by saliva of tissues altered by surgery, infection, or radiation therapy is a prime factor in retarding the progress of healing and fistula closure.

Use of the Montgomery® Salivary Bypass Tube following surgery has successfully prevented fistulae occurrence. The tube directs saliva into the distal esophagus and allows for spontaneous closure of the fistula, or at least permits the tissue to recover sufficiently to be an improved recipient for more formidable measures such as repair using pedicled skin flap tissue. A feeding tube may be inserted through the salivary bypass tube.

### INDICATIONS FOR USE:

Prevention of fistula formation following surgery.  
 Repair of cervical esophageal and hypopharyngeal strictures.  
 Management of esophageal and hypopharyngeal fistulae.

### SUPPLIED:

Sterile, 1 tube per carton
